

Data Download via ftps

Access Information

ftps-Server: delivery.infoterra.de

User ID: infoterra

Password: itd

Technical Requirements

For access to the TerraSAR-X Services Data delivery system, an FTPS capable client which supports FTP over TLS (explicit encryption) is required. Examples are:

- FileZilla Version 2.2.32
(for windows available at: <http://www.infoterra.de/download/tsxx/windows/ftps/>)
- WS FTP Pro
- ...

Servertype to configure in the FTPS client is „FTP over TLS (explicit encryption)".

The start of the communication is done by the client via port 990, the data transport is done by a dynamically between server and client handled out port (range 30200-30210).

Please be sure to have your firewall or socks proxy servers configured to allow these ports. If you're not sure about the firewall configuration, please ask your local network administrator about this point.
